Class13: RNASeq Analysis

Alice Lai (PID:A16799081)

The data for today's lab comes from a published RNA-seq experiment where airway smooth muscle cells were treated with dexamethasone, a synthetic glucocorticoid steroid with anti-inflammatory effects (Himes et al. 2014).

Import Data

```
# install.packages("BiocManager")
# BiocManager::install()

# BiocManager::install("DESeq2")

# library(BiocManager)
# library(DESeq2)
```

```
counts <- read.csv("airway_scaledcounts.csv", row.names=1)
metadata <-  read.csv("airway_metadata.csv")
```

```
head(counts)
```

```

Examine Data

Q1. How many genes are in this dataset?

```
nrow(counts)
```

```
[1] 38694
```

There are 38694 genes in the dataset.

Q2. How many 'control' cell lines do we have?

```
sum(metadata$dex == "control")
```

```
[1] 4
```

```
table(metadata$dex)
```

```
control treated
      4       4
```

There are 4 control cell lines.

```
colnames(counts) == metadata$id
```

```
[1] TRUE TRUE TRUE TRUE TRUE TRUE TRUE TRUE
```

If you want to know if all the elements of a vector are TRUE we can use the `all()` function

```
all(colnames(counts) == metadata$id)
```

```
[1] TRUE
```

Analysis

I want to compare all "control" and "treated" column. To do this I will find the average of each gene(row) in all "control" column.

```
control.inds <- metadata$dex == "control"
```

```
control.counts <- counts[,control.inds]
```

Now find the mean count value per gene using the `apply()` function.

```
control.means <- apply(control.counts, 1, mean)
```

Now do the same for the "treated" column.

```
treated.inds <- metadata$dex == "treated"
treated.counts <- counts[,treated.inds]
treated.means <- apply(treated.counts, 1, mean)
```

Put these two mean vectors together

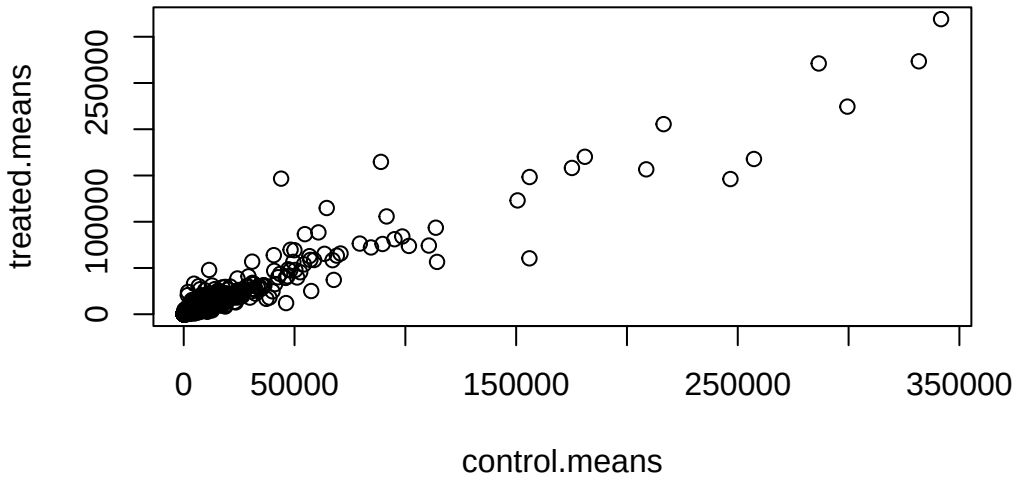
```
meancounts <- data.frame(control.means, treated.means)
head(meancounts)
```

```
                control.means treated.means
ENSG00000000003        900.75        658.00
ENSG00000000005          0.00          0.00
ENSG00000000419        520.50        546.00
ENSG00000000457        339.75        316.50
```

```
ENSG00000000460          97.25          78.75
ENSG00000000938           0.75           0.00
```

Let's have a look at the plot

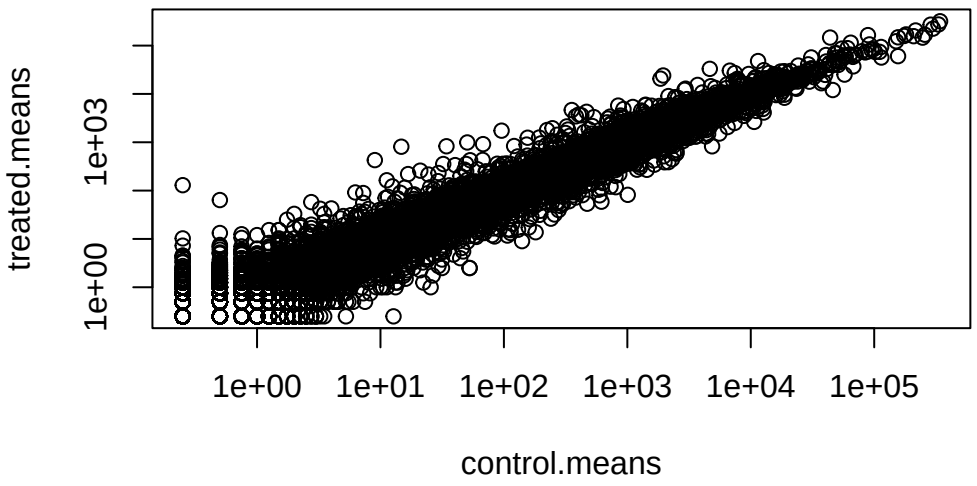
```
plot(meancounts)
```



```
plot(meancounts, log="xy")
```

```
Warning in xy.coords(x, y, xlabel, ylabel, log): 15032 x values <= 0 omitted
from logarithmic plot
```

```
Warning in xy.coords(x, y, xlabel, ylabel, log): 15281 y values <= 0 omitted
from logarithmic plot
```



We most often work with log2 units because they have a more simple interpretation. Here we calculate the log2 fold-change of treated/control values and add it to our wee data frame of results.

```
meancounts$log2fc <- log2(meancounts$treated.means / meancounts$control.means)

head(meancounts)
```

```
                control.means treated.means      log2fc
ENSG00000000003        900.75        658.00 -0.45303916
ENSG00000000005          0.00          0.00         NaN
ENSG00000000419        520.50        546.00  0.06900279
ENSG00000000457        339.75        316.50 -0.10226805
ENSG00000000460         97.25         78.75 -0.30441833
ENSG00000000938          0.75          0.00        -Inf
```

There are some answers like NaN (not a number) and -Inf (minus infinity) that are because there are zero-count genes in the dataset.

```
to.keep.inds <- (rowSums(meancounts[,1:2] == 0) == 0)
```

```
mycounts <- meancounts[to.keep.inds, ]
head(mycounts)
```

```
                control.means treated.means      log2fc
ENSG00000000003        900.75        658.00 -0.45303916
ENSG00000000419        520.50        546.00  0.06900279
ENSG00000000457        339.75        316.50 -0.10226805
ENSG00000000460         97.25         78.75 -0.30441833
ENSG00000000971       5219.00       6687.50  0.35769358
ENSG00000001036       2327.00       1785.75 -0.38194109
```

Q. How many genes do we have left after filtering the zero-count?

```
nrow(mycounts)
```

```
[1] 21817
```

A common threshold for calling a gene "up" or "down" regulated is a log2 fold change of +2 or -2.

Q. How many "up" regulated genes do we have?

```
sum(mycounts$log2fc >= 2)
```

```
[1] 314
```

Q. How many "down" regulated genes do we have?

```
sum(mycounts$log2fc <= -2)
```

```
[1] 485
```

DESeq analysis

We need to do this analysis properly with out inner stats person kept happy

```
library(DESeq2)
```

To use DESeq we need to get our input data in a very particular format

```
dds <- DESeqDataSetFromMatrix(countData = counts,
                              colData = metadata,
                              design = ~dex)
```

```
converting counts to integer mode
```

```
Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in
design formula are characters, converting to factors
```

Run DESeq analysis

```
dds <- DESeq(dds)
```

```
estimating size factors
```

```
estimating dispersions
```

```
gene-wise dispersion estimates
```

```
mean-dispersion relationship
```

```
final dispersion estimates
```

```
fitting model and testing
```

```
res <- results(dds)
head(res)
```

```

```

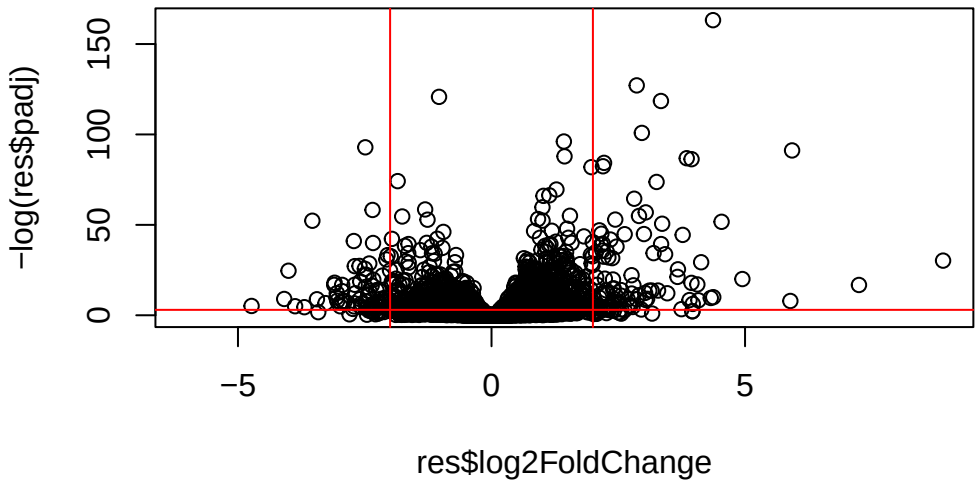
I want to make a figure showing an overview of all my results to date. A plot of **log2 fold change** vs the **p-value** (adjusted p-value)

```
plot(res$log2FoldChange, -log(res$padj))

# Add some cut-off lines
abline(v=-2, col="red")
abline(v=2, col="red")
abline(h=-log(0.05), col="red")
```

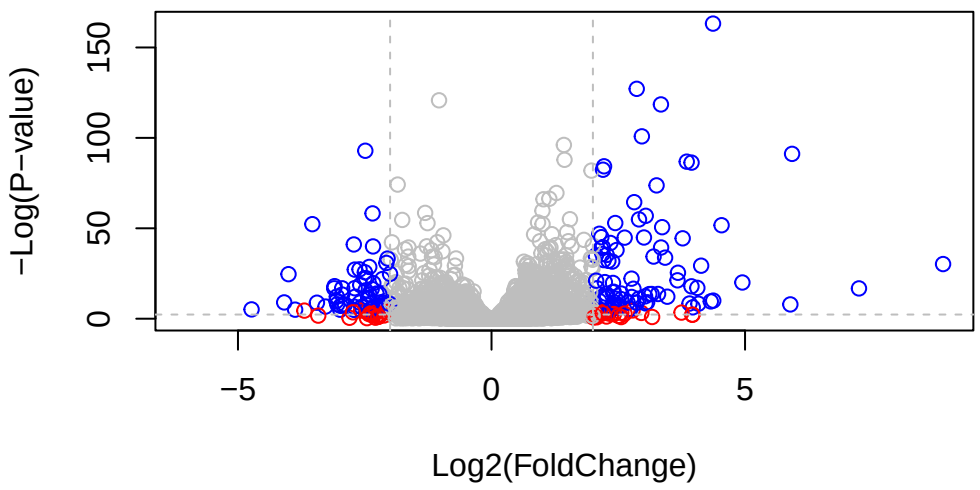


```
# Setup our custom point color vector
mycols <- rep("gray", nrow(res))
mycols[ abs(res$log2FoldChange) > 2 ]  <- "red"

inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2 )
mycols[ inds ] <- "blue"

# Volcano plot with custom colors
plot( res$log2FoldChange,  -log(res$padj),
 col=mycols, ylab="-Log(P-value)", xlab="Log2(FoldChange)" )

# Cut-off lines
abline(v=c(-2,2), col="gray", lty=2)
abline(h=-log(0.1), col="gray", lty=2)
```



Add annotation data

we want to add on gene symbols (gene names) as well as other common identifiers from major databases for all our genes of interest.

```
# BiocManager::install("AnnotationDbi")
# BiocManager::install("org.Hs.eg.db")
library("AnnotationDbi")
library("org.Hs.eg.db")
```

```
columns(org.Hs.eg.db)
